Chapter2:

- P4. Consider the following string of ASCII characters that were captured by Wireshark when the browser sent an HTTP GET message (i.e., this is the actual content of an HTTP GET message). The characters `<cr>` and `<lf>` are carriage return and line-feed characters (that is, the italicized character string `<cr>` in the text below represents the single carriage-return character that was contained at that point in the HTTP header). Answer the following questions, indicating where in the HTTP GET message below you find the answer.

```
GET /cs453/index.html HTTP/1.1<cr><lf>Host: gai
a.cs.umass.edu<cr><lf>User-Agent: Mozilla/5.0 (
Windows;U; Windows NT 5.1; en-US; rv:1.7.2) Gec
ko/20040804 Netscape/7.2 (ax) <cr><lf>Accept:ex
t/xml, application/xml, application/xhtml+xml, text
/html;q=0.9, text/plain;q=0.8,image/png,*/*;q=0.5
```

```
<cr><lf>Accept-Language: en-us,en;q=0.5<cr><lf>Accept-
Encoding: zip,deflate<cr><lf>Accept-Charset: ISO
-8859-1,utf-8;q=0.7,*;q=0.7<cr><lf>Keep-Alive: 300<cr>
<lf>Connection:keep-alive<cr><lf><cr><lf>
```

- a. What is the URL of the document requested by the browser?
- b. What version of HTTP is the browser running?
- c. Does the browser request a non-persistent or a persistent connection?
- d. What is the IP address of the host on which the browser is running?
- e. What type of browser initiates this message? Why is the browser type needed in an HTTP request message?

- a. Host: gaia.cs.umass.edu
GET /cs453/index.html

URL: <http://gaia.cs.umass.edu/cs453/index.html>

- b. HTTP/1.1(after "get" request)
- c. Connection: keep-alive
It's a persistent connection.
- d. There's no IP message here.
- e. Mozilla/5.0

P9. Consider Figure 2.12, for which there is an institutional network connected to the Internet. Suppose that the average object size is 850,000 bits and that the average request rate from the institution's browsers to the origin servers is 16 requests per second. Also suppose that the amount of time it takes from when the router on the Internet side of the access link forwards an HTTP request until it receives the response is three seconds on average (see Section 2.2.5). Model the total average response time as the sum of the average access delay (that is, the delay from Internet router to institution router) and the average Internet delay. For the average access delay, use $\Delta/(1 - \Delta\beta)$, where Δ is the average time required to send an object over the access link and β is the arrival rate of objects to the access link.

- a. Find the total average response time.
- b. Now suppose a cache is installed in the institutional LAN. Suppose the miss rate is 0.4. Find the total response time.

a.

$$\Delta = 850000b / 15Mbps = 0.0567s$$

$$\beta = 16/s$$

$$t\text{-receive} = \Delta/(1 - \Delta\beta) = 0.61s$$

$$t\text{-total} = t\text{-receive} + t\text{-inter} = 3.61s$$

b.

$$\beta_2 = 16/s * 0.4$$

$$t\text{-receive}_2 = \Delta/(1 - \Delta\beta_2) = 0.12s$$

$$t\text{-hit} = 850000b / 100Mbps = 0.0085s$$

$$t\text{-total}_2 = 0.4 * 0.0085 + 0.6(t\text{-receive}_2 + t\text{-inter}) = 1.8754s$$

P15. Read RFC 5321 for SMTP. What does MTA stand for? Consider the following received spam e-mail (modified from a real spam e-mail). Assuming only the originator of this spam e-mail is malicious and all other hosts are honest, identify the malicious host that has generated this spam e-mail.

```

MTA(Mail Transfer Agents) is an SMTP server and client providing Mail Transfer services.

When a message is forwarded to or from the Internet, the gateway must add a "Received" line, and it can't be changed in any way.

So, the first "Received" message(at the bottom) is the source address, which is 58.88.21.177.

P21. Suppose that your department has a local DNS server for all computers in the department. You are an ordinary user (i.e., not a network/system administrator). Can you determine if an external Web site was likely accessed from a computer in your department a couple of seconds ago? Explain.

Type "dig server" and change the server to the name of the website you want to test. If Query time is very short, it means that someone may have visited the website recently.

P25. Suppose Bob joins a BitTorrent torrent, but he does not want to upload any data to any other peers (so called free-riding).

- a. Bob claims that he can receive a complete copy of the file that is shared by the swarm. Is Bob's claim possible? Why or why not?
 - b. Bob further claims that he can further make his "free-riding" more efficient by using a collection of multiple computers (with distinct IP addresses) in the computer lab in his department. How can he do that?
-
- a. It's possible. Because there are vulnerabilities in BitTorrent that prevent uncooperative hitchhiking.
 - b. He can run clients on any host and give them a free ride, Then aggregate the chunks they collect into one file.
